

Media and Data Storage at our South San Francisco, California Facility

Some data is so critical, the livelihood of an organization completely depends on its preservation. In these cases, can you really justify taking chances with their integrity? DataSafe has the latest state-of-the-art, custom built, climate controlled vault systems in the nation, staffed with full time Vault Librarians. Our high security vaults, strategically located to provide rapid disaster recovery services, offer multiple levels of security—including 24/7 protection and surveillance.

Controlled, Safe and Secure Environment

DataSafe's Media Vaults are carefully engineered structures that exceed all federal government standards. We custom design and build our facilities so no chances will ever be taken with your most valuable assets. Opened in July 2007, DataSafe chose Invicta Durasteel of England to design and build our new highly secure media vault. The new vault is constructed of a revolutionary product called Durasteel. Durasteel is a composite of fibrecement with perforated metal sheets. It is non-combustible and widely used in the construction of fire resistant structures in Europe, and now the United States. Durasteel is extensively used in the petrochemical and ammunitions manufacturing industries, which makes use of its blast protection properties. The Durasteel product and construction have been broadly tested. This amazing new product provides a free-standing, four-hour fire rated vault with unprecedented structural integrity, all constructed on a foundation of bedrock. This new vault is considered one of the largest, most modern vaults in the world.

Software Management

Our powerful stand-alone application allows you to prepare your media for offsite storage, input descriptions and return

dates, manage tape and/or container rotation and generate reports, among other things. It even allows you to synchronize with our internal database for updated location information.

Fast and Safe Access

Even though your media is secure and protected, it is readily available. We offer convenient pickup and delivery service, including 24/7 holiday and emergency service.

Disaster Response Service

By sharing vital elements of your Disaster Recovery plan with us, you'll be in a better position if a declaration is made. There is no wasted time determining authorization levels or identifying alternate operating locations. On a quarterly basis, we will contact you and ensure the information we have on file is the most current.

Ideal for all types of Media including Music and Film Digital and Master Files

Our vault's temperature and humidity are controlled with such exacting specifications, we guarantee protection of your most sensitive media against fading, mildew, brittleness and drop out and accidental erasure.

Media and Data Storage at our Newark, California Facility

Some data is so critical, the livelihood of an organization completely depends on its preservation. In these cases, can you really justify taking chances with their integrity? DataSafe has the latest state-of-the-art, custom built, climate controlled vault systems in the nation, staffed with full time Vault Librarians. Our high security vaults, strategically located to provide rapid disaster recovery services, offer multiple levels of security—including 24/7, protection and surveillance.

Controlled, Safe and Secure Environment

DataSafe's Media Vaults are carefully engineered structures that exceed all federal government standards. We custom design and build our facilities so no chances will ever be taken with your most valuable assets. With eight-inch thick steel reinforced concrete walls, ultrasonic motion detectors, four hour fire rating, ionized smoke detectors, temperature and humidity controls, you can be certain your media will be fully protected from any element and available when you need it.
